PROFESSIONAL SUMMARY

Institutional Governance Architect specializing in the detection and correction of governance phase mismatches — gaps between an organization's stated governance structure and its observable operating behavior. Creator of the Ground-0 Phase Detection Algorithm, a deterministic institutional audit methodology, and the AGS++ (Accountability-Gated Systems) specification, a 447-page framework for designing accountability-gated systems that prevent autonomous escalation and preserve human authority in high-stakes institutional contexts. Methodology illustrated through public-domain case studies, including the Federal Reserve and Anthropic.

CORE COMPETENCIES

Governance Architecture & Audit

- Institutional phase detection (NAB, CWO, GSRB, NAB-Constrained)
- Governance mismatch identification and resolution
- Deterministic behavioral audit frameworks
- Authority structure analysis and documentation

Policy & Standards Development

- Governance standard specification (AGS++, PLV, SCAV++)
- Policy-to-operations translation
- Institutional risk assessment
- Compliance architecture design

Safety & Accountability Systems

- Accountability-gated system design (AGS++)
- Keyed human-machine hybrid governance (HMKH)
- Refusal-bound constraint architecture
- Observable outcome evaluation

Crisis Institutional Leadership

- Multi-site institutional coordination
- Cross-functional policy execution under pressure
- Institutional continuity under extreme conditions

PROFESSIONAL EXPERIENCE

Institutional Governance Architect & Constraint Systems Researcher

Independent / Harshal's Systems | 2020 – Present

Ground-0 Phase Detection Algorithm Development

- Designed a deterministic institutional audit methodology (v1.0) that compares an organization's claimed governance phase against its observable operating behavior, using a 5-question behavioral checklist
- Algorithm produces replicable phase classifications (NAB, CWO, GSRB, NAB-Constrained) with minimal interpretation bias; independent auditors using identical evidence are intended to reach identical conclusions
- Illustrative case study — Federal Reserve (based on public reporting): applying the framework to publicly available statements and structural characteristics highlights how an institution's persistent, largely irreversible decision-making authority (GSRB) can read differently from a more conditional, Congressionally constrained self-description (NAB-Constrained)
- Illustrative case study — Anthropic (based on public governance commitments): applying the framework to publicly stated safety commitments highlights the structural distinction between strong self-imposed internal constraints and externally enforced accountability
- Intent: give organizations a repeatable way to check their own governance claims against operating reality before a mismatch becomes a crisis

Accountability-Gated Systems Framework Design (AGS++)

- Authored formal specifications for accountability-gated autonomous system architectures designed to prevent autonomous escalation and preserve human authority
- Produced a comprehensive 447-page technical specification (AGS++ v0.2, self-published via Amazon KDP, September 2026)
- Framework incorporates Phase Declaration Headers, observable-outcome evaluation, threat modeling, and policy-to-operations translation
- Drafted for application across multiple institutional governance contexts

Governance Standards & Policy Architecture

- Created draft institutional standards: Provenance & Lineage (PLV), Contextual Inquiry Standards (TCS), Whyland Standards, and Intelligence & Unbiased Compliance Checks (IUC)
- Designed the Ground-0 Audit Guide: a deterministic methodology for detecting governance phase mismatches and institutional drift

- Developed the Duty Collation audit ledger concept: an immutable record structure for governance decisions and institutional transitions
- Outlined response protocols for detecting and correcting authority escalation in autonomous systems

Multi-Site Crisis Institutional Coordination (Singapore, 2024)

- Supported institutional coordination across agencies during a biosecurity incident
- Managed policy execution under extreme operational constraints
- Experience reinforced the case for transparent governance structures and continuous institutional audit

Financial Analysis & Research

Independent Analyst | 2018 – 2020

- Practiced financial analysis, market research, and institutional assessment
- Developed analytical frameworks for evaluating institutional behavior and incentive structures

EDUCATION & CREDENTIALS

Self-Directed Institutional Governance Research | 2020 – Present

- Focus: accountability architecture, autonomous system constraints, and institutional transparency

Professional Background

- Financial analysis practice (2018–2020)
- Operational experience in high-stakes institutional environments

PUBLICATIONS & WORK PRODUCTS

Published Work

- AGS++ v0.2: Accountability-Gated Systems Comprehensive Specification (Amazon KDP, September 2026) — 447-page formal specification for accountability-gated autonomous system architecture
- Ground-0 Phase Detection Algorithm v1.0 — deterministic institutional audit methodology, illustrated with public-domain case studies (Federal Reserve, Anthropic)
- Ground-0 Audit Guide — methodology for detecting governance phase mismatches and preventing institutional drift
- Duty Collation Audit Ledger (concept) — immutable governance decision record and institutional transition tracking

GitHub Repository

- Illustrative case studies (Federal Reserve, Anthropic), audit methodologies, governance frameworks, and technical documentation demonstrating the Ground-0 algorithm on public-domain examples
- Actively maintained with ongoing methodology refinement

KEY STRENGTHS FOR GOVERNANCE ROLES

Institutional Honesty

- Designed a methodology to surface when an organization's governance claims may not match its observable structure
- Communicates findings directly, grounded in evidence rather than organizational reputation

Practical Applicability

- Directly applicable to AI safety governance (assessing constraint strength before issues escalate)
- Useful for institutional due diligence, governance audits, and policy-to-operations translation

Deterministic Rigor

- Ground-0 algorithm is built on a fixed, binary checklist rather than subjective judgment calls
- Designed for replicable results: independent auditors working from the same evidence should reach the same conclusion

Crisis Institutional Leadership

- Experience operating across institutional boundaries under significant pressure
- Practical understanding of how governance failures happen and how audit can help prevent them
